

CloudPros

Azure Interview Questions and Answers

CloudPros

Beginner-Level Questions (1–5)

1. What is Microsoft Azure?

It's a cloud platform by Microsoft that lets you build, test, and manage applications using Microsoft-managed data centers.

2. What is a Resource Group?

It's a container that holds your Azure resources like VMs, storage, and databases—makes management easier.

3. What is Azure Virtual Machine (VM)?

A VM is a computer you can run in the cloud. You choose the OS, size, and storage, just like a real PC.

4. What is Azure Portal?

It's a web interface where you can control all your Azure services in one place.

5. What is Azure Subscription?

A subscription is like a container that holds your services and tracks your billing.

CloudPros

Beginner-Level Questions (6–10)

6. What is Azure Blob Storage?

It stores big unstructured data like images and backups.

7. What is Azure App Service?

It's a platform for hosting websites, REST APIs, and mobile backends.

8. What is Azure Region?

A region is a physical location where Microsoft keeps data centers, like "East US" or "West Europe".

9. What is Azure CLI?

A command-line tool to manage Azure resources using commands instead of the portal.

10. What is Azure ARM (Azure Resource Manager)?

It lets you deploy and manage Azure resources using templates and policies.

Intermediate-Level Questions (11–15)

11. What is Azure VNet (Virtual Network)?

It allows your resources to securely communicate with each other, the internet, or on-premises networks.

12. What is a Network Security Group (NSG)?

It controls inbound and outbound traffic to your resources, like a firewall.

13. What is Azure Load Balancer?

Distributes traffic across multiple servers so none get overloaded.

14. What are Availability Zones?

Physically separate zones within a region that help keep your app running even if one fails.

15. What is Azure Key Vault?

Used to store secrets, passwords, and certificates securely in Azure.

CloudPros

Intermediate-Level Questions (16–20)

16. What is Azure Functions?

It lets you run small bits of code (functions) without managing servers.

17. What is Azure DevOps?

A set of tools for CI/CD (Continuous Integration/Delivery), code management, testing, and deployment.

18. What is Azure Bicep?

It's a newer, simpler way to write infrastructure-as-code templates in Azure.

19. What is Azure Monitor?

Helps you track the performance and health of your services in real time.

20. What is Azure Cost Management?

Helps you track cloud spending, budgets, and optimize your usage.

CloudPros

Advanced-Level Questions (21–25)

21. How do you secure Azure Virtual Machines?

Use NSGs, Just-in-Time Access, strong passwords, encryption, and monitoring via Defender for Cloud.

22. What is Azure Policy?

It enforces rules like only allowing certain VM types or requiring tags for all resources.

23. What is Azure Private Link?

It lets your Azure services communicate privately through your VNet, not the public internet.

24. What is Azure ExpressRoute?

A private connection from your data center to Azure—better security and speed than public internet.

25. What is Azure Application Gateway?

A Layer 7 load balancer that supports routing, SSL termination, and Web Application Firewall (WAF).

CloudPros

Expert-Level Questions (26–30)

26. What is Azure Kubernetes Service (AKS)?

A managed Kubernetes service to run containerized apps in Azure.

27. How do you implement Disaster Recovery in Azure?

Use Azure Site Recovery, Geo-redundant storage, and cross-region replication.

28. What is Azure Synapse Analytics?

A powerful tool that combines big data and data warehousing for analytics.

29. What is Azure Lighthouse?

It lets managed service providers securely manage customers' Azure environments at scale.

30. What's the best way to manage multi-region deployments?

Use traffic managers, paired regions, load balancers, and data replication strategies.

Conclusion

Interviewing for Azure roles requires technical skills and real-life understanding of cloud tools.

These questions help you build confidence across core areas, networking, security, infrastructure, and DevOps. Keep practicing with hands-on labs, stay updated with Azure's new features, and bring real projects into your learning journey.
